Sketch 1 Track Lap Clock (Lap Timer)

Time loops around a circular running track, where each lap represents an hour.

Mouse click changes track color to show diff times of day

12 of these (clock hours)

runner moving clockwise

position on track -> sec()

track color -> hour()

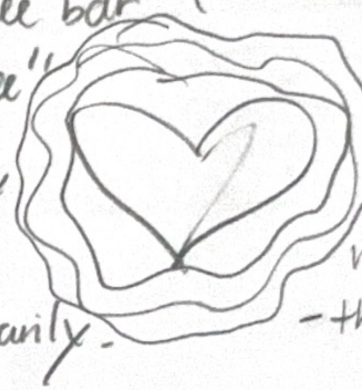
speed glow or motion -> min()

Sketch 2

The clock beats like a runner's pulse – seconds are heartbeats, min are breath cycles

pulsing ring

Interactivity:
pressing space bar increase's "pace" (heart rate) by doubling beat speed temporarily.



pulse = second()
color = min()
intensity = hour()

Every second, a ripple expands outward – then fades (to represent heartbeat)

– using red/pink tones to simulate warmth/ life

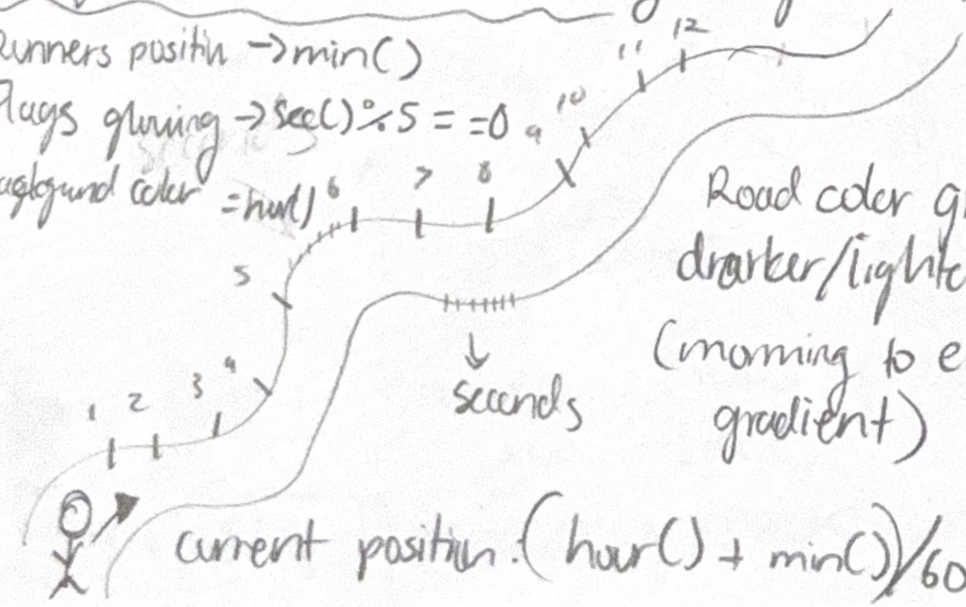
Sketch 3 | Route Progress Clock

Each hour is a long-distane route, & time progresses like a runner moving through checkpoints

Runners position → min()

Flags glowing → sec() % 5 == 0

Background color = hour()



Road color gradually darker/lighter (morning to evening gradient)

current position: (hour() + min())/60

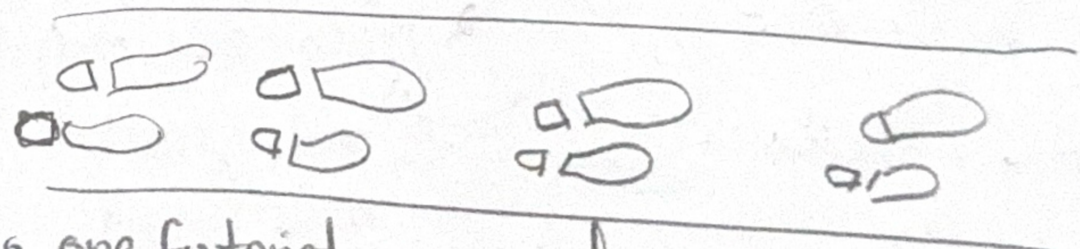
/60

ing

0

Sketch 4 Footstep Trail Clock

Each second leaves a footprint behind —
showing time as accumulated effort



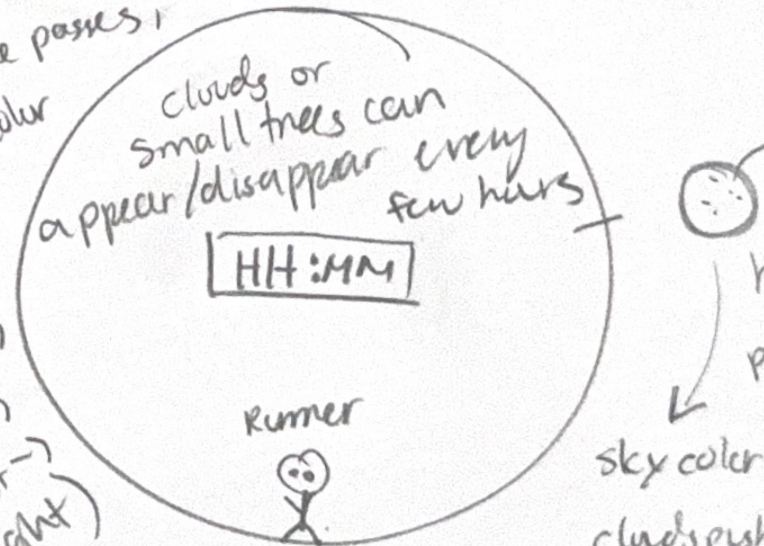
- one footprint per second
- Every min → clear trail & start fresh (loop resets)
- color the footprints from light to gray (slow) to dark (fast) as min increases
- can hover mouse to "rewind" & see past steps fade back in

life

Sketch 5 Sunrise Run Dial

Visualize a full-day run — a circular dial where the sun rises, peaks, & sets according to hour.

As time passes, the sky color gradients shift (morn → noon → sunset → night)



hour() position

sky color → min()

clouds pushing → sec()
