

Sketch 1 | Truck Loop Clock (Lap Timer)

Time loops around a circular running track, where each lap represents an hour.

Mouse click changes track color to show diff times of day

12 of these (clock hours)
runner moving clockwise

position on track → sec()
track color → hour()
speed glow or motion → min()

A circular running track acts as the clock face. A small runner icon loops around the track once every minute, with lap lines marking seconds. The pace of the runner visually encodes time

passing.

The clock's center shows a pulsing heart, expanding with ripples to mark each second like a heartbeat rhythm. The pulse rate reflects seconds, and the color intensity (or pulse speed) could shift through the day to mirror energy levels.

A winding trail winds through checkpoints labeled for hour marks. A runner progresses along the path as time passes and completing a "run" every hour. The background gradient (like sky shifting) could mark the passage of the day.

Sketch 4 Footstep Trail Clock

Each second leaves a footprint behind —
showing time as accumulated effort

ing
0

- one footprint per second
- Every min → clear trail & start fresh
(loop resets)
- color the footprints from light to gray
(slow) to dark (fast) as min increases
- Can hover mouse to "rewind" & see past steps fade back in

Each passing second leaves a new footprint behind on a linear path. Older footprints fade gradually, creating a trail that visualizes recent time. The length of the visible trail represents minutes.

Sketch 5 | Sunrise Run Dial

Visualize a full-day run - a circular dial where the sun rises, peaks, & sets according to hour.

A circular horizon dial shows a small runner and sun moving around in sync and the runner moves at the pace of seconds, and the sun's position marks the hour. The background changes from dawn to dusk tones to indicate time of day.
